EDO model packages

The Estimated Dynamic Optimization (EDO) Model is available from the Federal Reserve Board of Governors website:

The model package zip file (link below) contains the following files:

- A readme file with basic instructions.
- Dynare mod files to run two versions of the EDO model, one with variables in levels and the other with variables in log deviations from steady state. Both versions include the nonlinear equations derived from household and firm optimization problems. The version in levels more closely follows the derivations described in the article "Unemployment During the Great Recession in the EDO Model of the U.S. Economy", while the version in log deviations facilitates the reporting of simulation results. These programs solve the model, report some basic model statistics, and run some basic impulse response simulations.

Notice that the edo (zip) is actually contained in the "EDO variable listing (ZIP)" link and the mentioned "variable listing zip file" doesn't seem to be available anywhere:

The variable listing zip file (link below) contains an HTML representation of the EDO model, showing linkages between variables, parameters, and equations.

EDO variable listing (ZIP)

NOTE: The programs for simulating the EDO model are written for use with the Dynare software package. The Dynare package can be downloaded without cost at www.dynare.org. While Dynare itself is free, it requires the installation of either Matlab or Octave. Matlab is a commercial product available at www.mathworks.com. Octave is free-ware, and is available at www.gnu.org/software/octave.

Dynare and octave were available in The Ubuntu Software Center for my computer. From the readme file, to execute the model:

5) Run the command "dynare linearized" or "dynare Dynare.edo" from the Matlab/Octave command line to run the two model versions

The model fails for me and when googling for the error "dynare linearized trans_A undefined" we get

At the moment, Octave 4 is not supported yet. See <https://github.com/DynareTeam/dynare/issues/1113>

at "Trans_A Matrix error" and "Make Dynare compatible with Octave 4.0 #1113".

How to run the model:
=====

In Matlab/Octave:

- 1) Download Dynare Version 4 from the Dynare website: <http://www.dynare.org/>
- 2) Download the EDO files in a folder you choose.
- 3) Start Matlab/Octave and change the current directory to the folder in step 2.
- 4) Link in Matlab/Octave the Dynare folder in the menu under file/Set Path (or use the command "addpath path/to/dynare").
- 5) Run the command "dynare linearized" or "dynare Dynare_edo" from the Matlab/Octave command li

Content of the EDO folder:
=====

Dynare_edo.mod: Dynare model file containing the latest estimated parameters and nonlinear mode

Dynare_edo_steadystate.mod: Dynare steady-state file computes the steady state of the model var

linearized.mod: Dynare model file containing the latest estimated parameters and nonlinear mode

linearized_steadystate.mod: Dynare steady-state file computes the steady state of the model var
